DRAGON POWER™

Actually reduces wear to crankshaft main bearings, camshaft bearings and all internally lubricated engine components as it cleans the entire fuel system.*

Dragon Power™'s patented formula is OEM (original equipment manufacturer) approved.

*The two main sources of lubricant contamination are blow-by from the combustion chamber, and gases and volatiles from the crankcase that are vented into the intake manifold as an anti pollution measure. The various gases interact with one another and the lubricant to form soot, carbon, lacquer, varnish and sludge. Blow-by that contains Dragon Power™ effectively decreases engine wear instead of reducing the effectiveness of the engines' lubricant.

Dragon Power™'s polyetheramine technology is more effective at controlling and removing Combustion Chamber Deposits than synthetic PIB Amine technology found in competitor's products.

Conveniently packaged in a long neck bottle for easy pouring, and has a "pull tab" seal to reduce leakage in transport.

Safe and effectively used as a fuel system cleaner for diesel and bio-fuel powered vehicles.
